Results from Timing Test.

Question: Why are the runtimes for the first test so similar

Answer: For the first element test such as 10 to 100 the number of elements are in computer terms,

very merger numbers. 100 elements are virtually nothing to a computer in this day and age where big

data is a thing. 10 to 100 elements are so few that it doesn't really matter what sort is used. The amount

of accuracy error could be such that the times are indistinguishable.
